

Sample speech (not final version):

Honorable Chairman and Fellow Delegates,

Considering the unique nature of climate change and the immense impact that it can cause, there is a need for a better plan to combat climate change to avoid international conflict. Resources need to be shared throughout countries instead of disagreements of who should get what. However, we also need to go to the root of the problem. The Czech Republic suggests the establishment of the Clean Energy Initiative, which would initiate the switch from fossil-fuel power to cleaner energy sources, such as nuclear and water power. It would also subsidize car companies globally to increase the pace of advancements in electric cars and decrease the impact of a ban on combustion-powered vehicles on the economy. The Czech Republic also urges the establishment of the Global Resources Initiative, which would increase the transparency between countries for data statistics on the necessary resources and equally distribute the appropriate number of essential resources throughout all countries. If any conflict arises between countries or natural disasters, such as forest fires and droughts, every member nation should create a plan to deal with those situations.

The delegate of the Czech Republic now yields his time to the chair.

Final speech (1 min and 26 seconds, 59 secs without yellow):

Honorable Chairman and Fellow Delegates,

Climate change has already begun depleting our essential resources and causing international strife. The UN has significantly benefited from the Paris Agreement and Kyoto Protocol, but there is still much more to be done.

The Czech Republic supports creating a child initiative of the Paris Agreement called the Global Resources Initiative. The Global Resources Initiative would improve data transparency between countries for data statistics on necessary resources and distribute the proper number of essential resources evenly among all nations.

Furthermore, Czechia calls upon each member state to develop a country-specific plan to deal with natural catastrophes and conflicts. It would be based on the Czech Republic's National Action Plan on Climate Change Adaptation, which has been in effect since 2017 and has improved emergency response times. The foundations of each strategy would be to construct robust highways and infrastructure and have emergency measures in a natural disaster.

However, before climate change causes more conflict than we can handle, we must address the source of the problem. The Czech Republic proposes the formation of the Clean Energy Initiative, which would fund vehicle firms to accelerate electric car advancements and reduce the economic impact of a combustion-powered car ban. The Clean Energy Initiative would also

kickstart the transition away from fossil fuels and toward renewable energy sources like wind and hydropower.

The Delegate of the Czech Republic now yields his time to the chair.

Bullet points:

- Global resources initiative
 - Build off of the part in the Paris Agreement where, every five years, countries get together and share their plans on curbing greenhouse gas emissions
 - Increase the transparency between countries for data statistics on the necessary resources
 - Equally distribute the appropriate number of necessary resources throughout all countries.
 - Stop conflict occurring from climate change by sharing resources to take away the incentive for countries to fight each other for it.
 - Removing the aim of the conflict from the equation would remove the incentive for countries to go to war.
- Plan for natural disasters and conflict between countries
 - Build resilient highways and other infrastructure
 - Forest fires, droughts, rising sea level floods
 - Modeled after National Action Plan on Adaptation to Climate Change (used in the Czech Republic since 2017), to adapt to specific climate change effects in the Czech Republic
- Clean Energy Initiative:
 - Subsidize car companies
 - Increase the pace of advancements in electric cars
 - Decreases the impact of a ban on combustion-powered vehicles on the economy
 - Initiate the switch from fossil-fuel power to cleaner energy sources
 - Wind power
 - Hydropower
 - Nuclear power
 - Solar power
 - Why use this and not other policies:
 - Some other good policies: Paris Agreement and the Kyoto protocol
 - A lot of policies are designed and implemented at the local level and are unlikely to be effective throughout countries
 - More job opportunities for research of new policies and how this policy would be implemented so no cons
 - Example of con:
 - California cap-and-trade rule

- establishes a declining limit on major sources of GHG emissions throughout California
- Increased regulatory costs from the cap-and-trade rule only raise the burden for less financially capable businesses. They discourage them from investing and producing in states with costly climate change policies and incentivize them to shift their emissions to plants they own in less-regulated states.
